## AwareManager iOS 4.0

CHANGE: User Interface overhaul

The user interface of the app has been significantly updated. The color scheme has been updated
- Home screen now has icons for Add Work, Work Search, and Barcode Search
- Larger and more easily-readable text
- Offline queue can now be accessed from anywhere within the app
- Settings can now be accessed from anywhere within the app

New: Viewing attached PDFs

PDFs linked to Work, Equipment, or Units can now be viewed within the app.

Fix: Viewing Images

Images can now be viewed in full-screen mode.

CHANGE: Attaching Photos

Attaching a photo to a Work record has been altered to make it easier and more user-friendly.

CHANGE: Constraints

Previously, fields that contained a constraint (i.e. Equipment Type selection constrains Equipment choices) would show no records if the parent selection (Equipment Type for example) did not have any records linked to it. This has been changed so that now all records will be shown if the first selection doesn't have any linked records.

New: Adding Total Time

You can now add "Total Time" in a Time record in addition to recording Start and Stop times.

Barcoding

CHANGE: Barcoding now supports searching on Work linked Readings

If a Work order has Readings linked to Equipment or Unit records, the barcode search now allows for searching on these Readings.

Fix: After updating Readings via barcode search, revision history is now recorded in AwareManager

When editing Readings from a barcode search, revision history is now logged in the full AwareManager application.
