System-Wide

CHANGE: (Android) Migration of Local Searches

With this release, the saved searches that you have stored under your mobile profile will be migrated to the cloud, which will allow the administrator for your AwareManager account to sign in and make changes on your behalf, should you be having an issue with your criteria. To ensure these are in fact pushed to the cloud, users will need to click on the Upload button in the top toolbar just next to the Add button.

CHANGE: Constraining of Equipment

Found within the Gateway Admin page under Mobile Settings, this feature when disable caches all Equipment and Unit records (both Global and Division specific), the moment a user signs into mobile. When this feature is enabled, the caching of Equipment and Unit records occurs after a search is requested and work records are returned in your search. This will only cach Equipment and Units that are relevant to the search you are performing – specifically those linked to Work Orders.
